

Scale & Proportion :-

They are closely related but different

They both describe shape, size and amount

They are both concerned with the relationships of objects and parts of objects

Proportion :-

It is the ratio/fraction of one part to another part or of one part to the whole.

It is an important factor when selecting and positioning furniture and accessories in a room,

2:1, 5:8, 3:5

Rectangle has more pleasing proportions than a square.

Scale :-

Relates to the size of a design in relation to other items or the surrounding area in which it is placed.

To achieve good scale, choose objects that are appropriate for human dimensions and the proper size for the space they occupy.

60-30-10 Rule

60% + 30% + 10% proportion is meant to give balance to the colors used in any space.
